### RELIABILITY ESTIMATE

1. The reliability prediction contained herein is prepared in conformance with the requirements of the reliability mathematical Model CDRL ITEM 006.
2. This reliability prediction is accomplished on the Static Inverter, Engineered Magnetics Model EMIR302, at the piece part level using the assumption as stated below.
  - 2.1 Failure rate is derived from the MIL-HDBK-217B for the "ground fixed" environment.
  - 2.2 Ambient temperature assumed is 50°C.
  - 2.3 Actual component stresses is used in the failure rate calculation.
3. The calculation for the failure rate is shown in the attached worksheet. The MTBF is calculated by summing the individual component part failure rate and then taking the reciprocal of this sum, i.e.,

$$MTBF = \frac{1}{\sum \lambda_i}$$

Where  $\lambda_i$  = individual component part failure rate.

4. The following is a tabulation for the individual assembly.

| ASSEMBLY   | $\lambda$ FAILURE RATE (F/HR)              |
|--|--|
| A1   | $33.274 \times 10^{-6}$                    |
| A2   | $33.274 \times 10^{-6}$                    |
| A3   | $33.274 \times 10^{-6}$                    |
| A4   | $6.33 \times 10^{-6}$                      |
| A5   | $8.407 \times 10^{-6}$                     |
| A6   | $.1454 \times 10^{-6}$                     |
| Chassis  | $6.48 \times 10^{-6}$                      |
| Miscellaneous<br>(Connection, PC<br>Board, etc.) | $12.1 \times 10^{-6}$                      |
|  | $\Sigma \lambda_i = 133.29 \times 10^{-6}$ |

Therefore MTBF =  $\frac{1}{133.29 \times 10^{-6}}$   
= 7502 hours.

5. The MTBF for the Static Inverter is 7502 hours which exceeds the requirement of 1200 hours per Army specification EED76022501, Paragraph 3.5.

APPENDIX
